

Amendments to the Claims:

This listing of claims will replace all prior versions, and listings, of claims in the application:

Listing of Claims:

1. (Previously presented) A computer-implemented method for dynamically creating a network based application form comprising the steps of:

receiving a request from a customer computing system to apply for a plurality of products, the request received over a network at a host server, wherein specific information is required to be submitted to apply for each one of the plurality of products;

dynamically assembling, using a computer processor at the host server, in response to the request, an application page for display over the network, said application page having multiple fields, the application page assembled from a plurality of documents, wherein each document of the plurality of documents contains at least one field required to apply for one of the plurality of products; and

receiving information input at the host server from the customer computing system corresponding to each field contained in the application page.

2. (Original) The method of claim 1, further including the steps of:

validating the information input by comparing the information input to validation criteria; and

when the information input fails to correctly compare to the validation criteria, assembling a second application page including prompts to reenter information and receiving correction information input.

3. (Original) The method of claim 1, further including the step of forwarding the information input to a decision module for processing the information input.
4. (Original) The method of claim 1, further including the steps of:

determining whether the request to apply originates from a customer that is logged in to a session manager;

accessing stored data regarding the customer if the customer is logged in, wherein the step of assembling an application page includes inserting the stored data in the application page displayed over the network.
5. (Original) The method of claim 1 wherein the plurality of products includes banking products and the specific information required to apply for one of the plurality of products includes information regarding an amount of credit to be extended.
6. (Original) The method of claim 5 further including the step of forwarding the information input to a decision module for processing the information input to determine if data input justifies extension of credit.
7. (Original) The method of claim 1 wherein the request is in the form of parameters received within a universal resource locator.

8. (Previously Presented) A computer-implemented system for obtaining application data from an applicant through a dynamically created network based application form comprising:

a dynamic application module utilized by a host server for receiving a request over a network from a customer computing system to apply for at least two of a plurality of products, the dynamic application module determining categories of information required for the at least two selected products, the dynamic application module dynamically creating an application requesting data corresponding to the information categories from the customer computing system required to apply for the at least two of a plurality of products, and receiving the data requested; and

a decision module utilized by the host server, the decision module in communication with said dynamic application module, said decision module for receiving the data, generating a decision regarding the application using a computer processor, and providing the decision to said dynamic application module.

9. (Original) The system according to claim 8 further comprising:

a universal session manager in communication with said dynamic application module, said universal session manager for creating a verification of an originator of the request; and

a profile database in communication with said dynamic application module, said profile database for providing stored data regarding the originator of the request.

10. (Previously Presented) The system according to claim 9 wherein said dynamic application module, said universal session manager and said database reside on said host server.

11. (Canceled)

12. (Original) The system according to claim 11 wherein said dynamic application module provides the application in the form of an application page over the network to the originator of the request.

13. (Original) The system according to claim 8 further including a processing database in communication with said dynamic application module, said processing database for receiving data regarding use of said dynamic application module.

14. (Previously Presented) A computer-implemented method for dynamically creating a network based application form comprising the steps of:

receiving, over a network at a host server, a request to apply for at least one of a plurality of products in the form of a uniform resource locator, wherein specific information is required to be submitted to apply for each one of the plurality of products;

parsing the uniform resource locator to identify the at least one of a plurality of products;

dynamically assembling an application page using a processor at the host server for display over the network, said application page assembled from a plurality of documents, wherein each document of the plurality of documents contains at least one field corresponding to the specific information required to apply for one of the plurality of products; and

receiving, at the host server, information input corresponding to each field contained in the application page.

15. (Original) The method of claim 14, further including the steps of:
- validating the information input by comparing the information input to validation criteria;
- and
- when the information input fails to correctly compare to the validation criteria,
- assembling a second application page including prompts to reenter information and receiving corrected information input.
16. (Original) The method of claim 14, further including the step of forwarding the information input to a decision module for processing the information input.
17. (Original) The method of claim 14, further including the steps of:
- determining whether the request to apply originates from a customer that is logged in to a session manager;
- accessing stored data regarding the customer if the customer is logged in, wherein the step of assembling an application page includes inserting the stored data in the application page displayed over the network.
18. (Original) The method of claim 14 wherein the plurality of products includes banking products and the specific information required to apply for one of the plurality of products includes information regarding an amount of credit to be extended.

19. (Original) The method of claim 18 further including the step of forwarding the information input to a decision module for processing the information input to determine if data input justifies extension of credit.

20. (Previously Presented) A computer-implemented method for dynamically creating a network based application form comprising the steps of:

receiving, at a host server, a request over a network from a customer computing system to apply for at least one selected product from a plurality of distinct products, wherein each of the plurality of distinct products corresponds with a set of information categories, wherein at least a first set of information categories corresponds to a first distinct product and a second set of information categories corresponds to a second distinct product and the first set differs from the second set;

identifying a selected set of information categories corresponding to the selected product;

dynamically assembling an application page using a processor at the host server in response to the request, the application page for display over the network, the application page assembled from a plurality of documents, each document providing at least one field corresponding to one of the information categories from the identified selected set of information categories; and

receiving information input corresponding to each field contained in the application page.

21. (Previously Presented) A computer-implemented method for dynamically creating a network based application form comprising the steps of:

receiving a request at a host server to apply for at least a first product and a second product from a plurality of products, the request received over a network, application for each of the first product and the second product requiring specific information, wherein a first set of specific information is required to be submitted to apply for the first product and a second set of specific information is required to be submitted to apply for the second product, wherein the first set differs from the second set;

dynamically assembling an application page using a processor at the host server for display over the network, said application page assembled from a plurality of documents, wherein each document of the plurality of documents contains at least one field corresponding to the specific information required for application; and

receiving information input over the network corresponding to each field contained in the application page.
